

External / Outdoor Hot Water Systems

Hot water heaters require a solid support base to sit on, this can be in the form of a concrete or poly base, a pathway maybe suitable as well

All external hot water systems must be installed on a concrete base, hot water systems can weigh up to 550kg when full of water, so a solid base is required to support it evenly and also lift above the ground to prevent corrosion. Our ripple slabs with the wave top design allows water to flow underneath, not having the tank sit on a wet base.

If there is a pathway or concrete patio etc a slab may not be required
